About me

Alexandru Constantin ILIESCU

- Machine Learning experience:
 - 1st year of master in Machine Learning at Politehnica University Timisoara
 - Bachelor Thesis on High-Quality Point Clouds Generation
 - At CoreAI for approximately 3 months

Scoliosis

- is a sideways curvature of the spine
- about 3% of adolescents have scoliosis
- there are different types of scoliosis
- surgery may be needed in order to solve the problem

TYPES OF SCOLIOSIS

Apifix and Scoliosis

When surgery is needed, a metal rod is attached to the spine with screws, such that the fusion will work ok.

- The angle of scoliosis of the patient
- Different measurements that are needed
- The positions of the screws needed for the metal rod

Architecture of U-Net

Architecture of U-Net

Architecture of U-Net

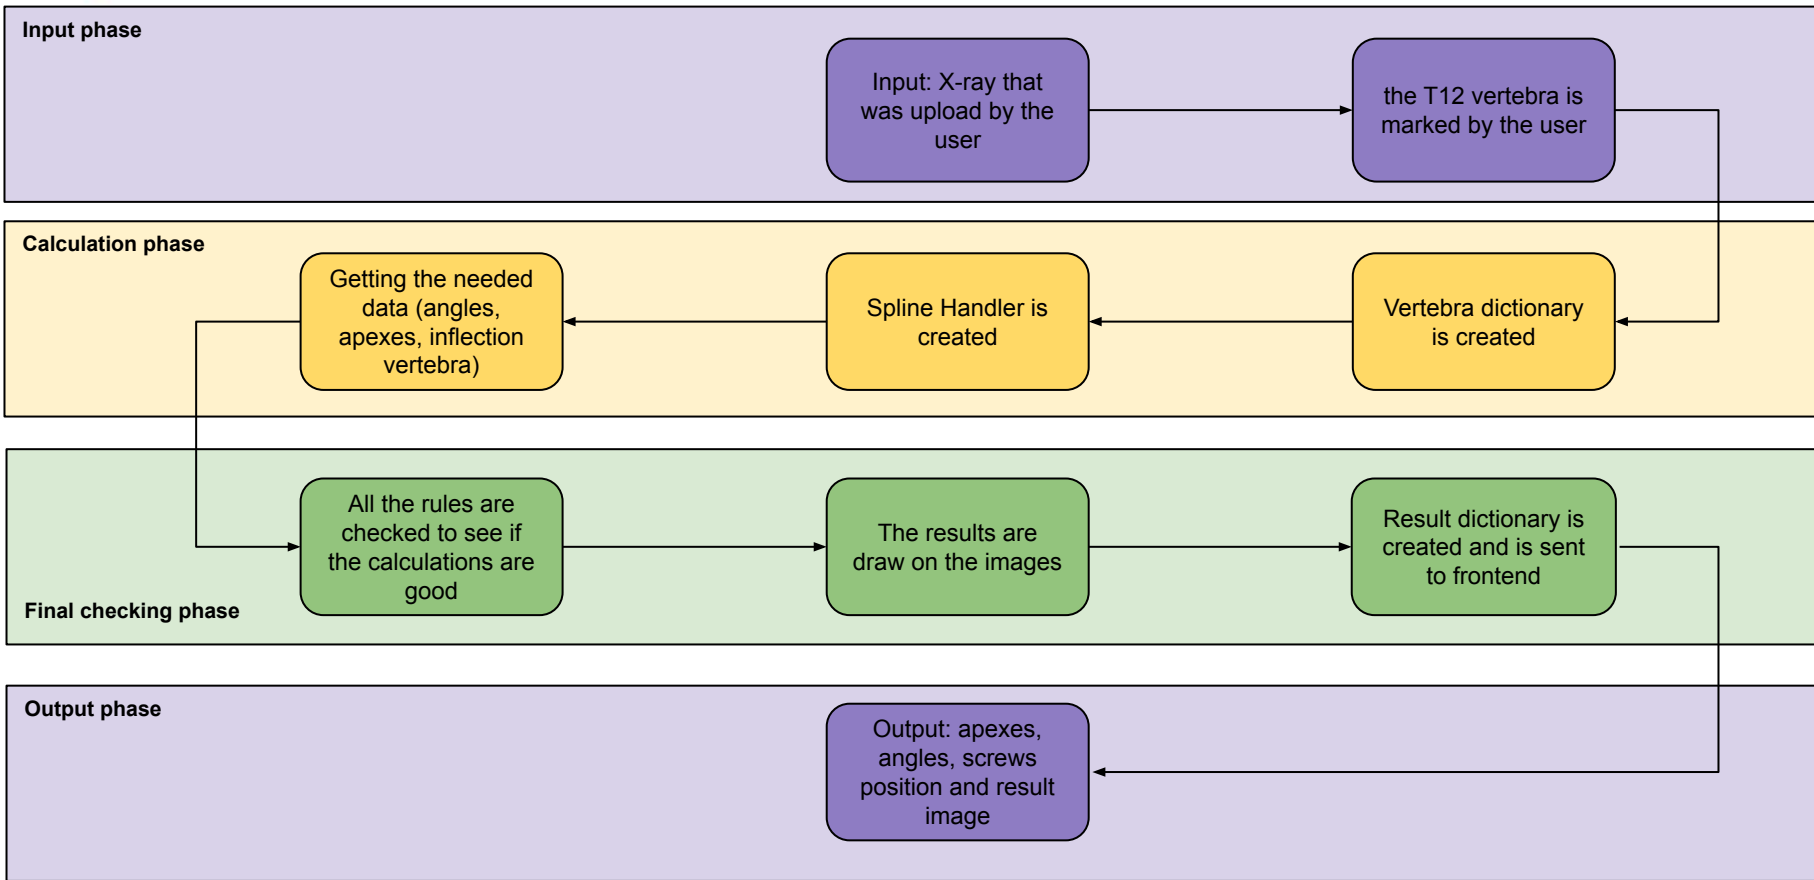

Architecture of U-Net

Flow of the system

Getting the vertebra data

- In order to use the image for getting the vertebra, a **local histogram equalization** is done
- This image is used for spine segmentation map and for calculating the bounding box of it
- Using the bounding box, the spine is cropped from the image
- The resulted image is used for getting the vertebra segmentation map
- This segmentation map is used for getting the vertebra data

Dilation for improving the model

Getting the final data

- We obtain the spline
- We calculate the inflection points, depending on the type of the scoliosis
- We calculate the angles, apexes
- Screws are placed according to the rules that we have to follow

$$\tan(\theta) = \frac{m_1 - m_2}{1 + m_1 m_2}$$

$$\text{angle} = \text{atan2}(y_2 - y_1, x_2 - x_1)$$

Getting the final data
